Ben,  
Very interesting. Thank you for the information. I may touch base with you next week on some other site related questions.

Yes, I did get the meters to work. The battery terminals on the one with the audible alarm needed a little cleaning.

Thanks again!

-Pete

Pete,

Attached are the results we were provided, though never went anywhere with since TCC submitted it right before they went into bankruptcy.

**Ex. 7(a)**

On an aside, did you get the water meters to work?

Ben

Thank you for the information, this is very useful.

Ben,

Going back to the stockpiles of screen soil: So has it been tested? If so, do you have the analytical?

Thanks and Happy Thanksgiving to both of you.

-Pete

**Subject:** FW: TCC

Hi Peter,

Just as an FYI I asked Ben Mcpherson to take a look at the Parsons IRM WP for site 108. He provided me a few minor comments so I thought I would just forward them on to you (See below).

Let me know if you have any questions for Ben or myself and have a great Thanksgiving.

Thanks.

**Subject:** RE: TCC

- 1) We only allowed berm water to be discharged to the ground surface during the investigation and initial phase of the IRM. As soon as the interior of the berms were disturbed by the IRM the coal tar starting creating sheens and I made them pump the water and treat through the Main Plant system.
- 2) Page 2, Cut Pipes and Plastic Sheeting: the pipes near Tank 2 were cut during the IRM when the demolition of the tanks was still to be completed by TCC. The majority of the tar/water mixture that is there flowed out of the pipes (from the direction of the pump house), not the valve EPA refers to. It is possible that the valve is leaking, but most of the tar/water is from the pipes or what was already within the berm when the IRM started.
- 3) Page 4, Soil Pile Tarping: this is the IRM screened soil. This plan does not make it clear that the soil pile is related to the IRM and that it has been tested, and more importantly that it was derived from listed hazardous waste.
- 4) Page 4, Berm System Monitoring: I have calculated that the berms need 2 feet of freeboard.
- 5) Page 4, ACM Tanks: pipe wrap does contain ACM. TCC did a small asbestos abatement to cut the pipes connecting the tanks.
